

Fork Positioners

A fork positioner is actually a device constructed out of top quality materials meant to endure the most demanding procedures and work environments. This piece of equipment could enable the one driving to work the blades hydraulically without leaving the seat. Side shifting models have the added ability to laterally position the arms or the entire load so as to facilitate more exact lifting and position in a quicker and much more effective method.

The unique fork pocket design can enable the individual operating it to securely sway the unit's forks without any worry of damaging the positioning cylinders. This can allow the operator the choice to either perform simultaneous or independent blade movement, depending on the job requirement. For most lift trucks with non-OEM carriages, complete carriages are needed. Standard OEM carriages could be converted into fork positioners on existing units.
